

Solar at the Coal Face

As part of its move to decarbonising its energy use, Centennial has commenced a solar installation programme. Centennial was keen to test different technologies and embraced the opportunity to try out the 5B Maverick solar system at its now closed Awaba Mine in NSW, Australia. Today, solar panels are powering the ongoing maintenance and rehabilitation of the site.

From the ground up, this **5B Maverick solar system**, fitted with the latest solar panel manufactured by **Yingli Green Energy**, demonstrates that solar technology has no boundaries. With an abundance of free sunshine, it's no wonder that the uptake of renewables is diversifying and rapidly growing around the world.
